

Vadim Boltach

Senior Frontend Engineer · 10+ years of experience

London, UK (relocating from Canada) · vadim@boltach.com

Frontend engineer with a decade of experience at both startups and large companies. I'm comfortable with ambiguity and like figuring out what to build, not just closing tickets. I ship product features, build design systems, clean up codebases, and improve DX so other engineers can move faster. I care about architecture, UX, and visual detail.

Experience

Coursera — Senior Software Engineer

Toronto, Canada · Jan 2022 – Sep 2024

Stack: React, TypeScript, JavaScript, Design Systems, Accessibility (A11y), WCAG, RTL, i18n, Storybook, Figma

Core contributor to Coursera's design system and component library, used daily by ~100 engineers and designers across the org.

- Led end-to-end migrations of the typography and color systems. Worked with design on variant mappings, introduced CSS variables, shipped new library versions while deprecating old APIs, and implemented codemods to migrate dozens of modules in a 10-year-old codebase automatically. Presented the rollout plan to engineers and designers across the org, gathering feedback to shape the final approach.
- Drove a performance initiative to reduce the design system's footprint. Introduced bundle size monitoring so dependency decisions could be made with real data, and refactored i18n to use precompiled translations, cutting significant bundle size across the library.
- Shipped a wide range of components, from primitives like buttons and inputs to complex interactive patterns. Everything was built with RTL and accessibility support out of the box, following WCAG 2.1.
- Redesigned component APIs to use React Context instead of the Children API, removing strict composition rules and improving DX across the library.

Thrivr Technologies — Senior Software Engineer

Toronto, Canada · Jan 2019 – Jul 2021

Stack: React, Angular, TypeScript, JavaScript, GraphQL, Apollo, Cypress, Jest, CI/CD

One of the first senior engineers on a rapidly growing team. The codebase was scaling faster than its foundation, so most of my work was about bringing in structure, processes, and shared tooling.

- Introduced CI/CD, release cycles, and a stable end-to-end test suite, improving website stability and developer productivity.
- Improved website performance with bundle size monitoring, asset caching, lazy loading, and CDN integration.
- Built a design system and component library together with designers, replacing the inconsistent UI patterns that had built up across the app.
- Led the migration of a large Angular codebase to React.
- Mentored engineers on frontend architecture and state management patterns (Redux, Apollo cache) as the codebase grew.

Juno Inc — Frontend Engineer

Minsk, Belarus · Apr 2017 – Nov 2018

Stack: React, Redux, Leaflet, Webpack, JavaScript

Ride-sharing service acquired by Gett, later sold to Lyft. Built real-time GPS debug tooling and internal systems used by support and onboarding teams. Also unified build infrastructure across the frontend projects.

Captiv8 — Frontend Engineer

Minsk, Belarus · Sep 2015 – Apr 2017

Stack: React, Redux, AngularJS, Google Charts, JavaScript, ExpressJS

Worked on a data-heavy social analytics platform as part of a small two-person team. Built interactive dashboards with tables, maps, and charts.

Exadel — Software Engineer

Minsk, Belarus · Oct 2013 – Sep 2015

Stack: Java, Spring, AngularJS, jQuery, JavaScript

Built reusable components for a legal documentation framework at Wolters Kluwer.

Education

Belarusian State University — Master's Degree in Applied Mathematics · Minsk, Belarus · 2011 – 2016
